2.4 Safety Precautions

Before operating this system, read the following information carefully to protect your systems from damages, and extend the life cycle of the system.

1. Check the Line Voltage

- The operating voltage for the power supply should be 9~48V DC; otherwise, the system may be damaged.

2. Environmental Conditions

- Place your IV-Z318 system on a sturdy, level surface. Be sure to allow enough space around the system to have easy access needs.
- Avoid installing your IV-Z318 system in extremely hot or cold places.
- Avoid direct sunlight exposure for a long period of time (for example, in a closed car in summer time. Also avoid the system from any heating device.). Or do not use IV-Z318 system when it has been left outdoors in a cold winter day.
- Avoid moving the system rapidly from a hot place to a cold place, and vice versa, because condensation may occur inside the system.
- Protect your IV-Z318 system from strong vibrations which may cause hard disk failure.
- Always shut down the operating system before turning off the power.
- Do not place the system too close to any radio-active device. Radio-active device may cause signal interference.

3. Handling

- Please keep the system away from human bodies while the system is active and in operation. If engineers need to service or move the system, please power off the system and wait for the system to cool down and then engineers can conduct the servicing safely.
- Avoid placing heavy objects on the top of the system.
- Do not turn the system upside down. This may cause the hard drive to malfunction.
- Do not allow any objects to fall into this device.

4. Good Care

- When the outside case gets stained, remove the stains using neutral washing agent with a dry cloth.
- Never use strong agents such as benzene and thinner to clean the surface of the case.
- If heavy stains are present, moisten a cloth with diluted neutral washing agent or alcohol and then wipe thoroughly with a dry cloth.
- If dust is accumulated on the case surface, remove it by using a special vacuum cleaner for computers.

3.3 Component Locations Of System Main Board

3.3.1 Top View of System Main Board

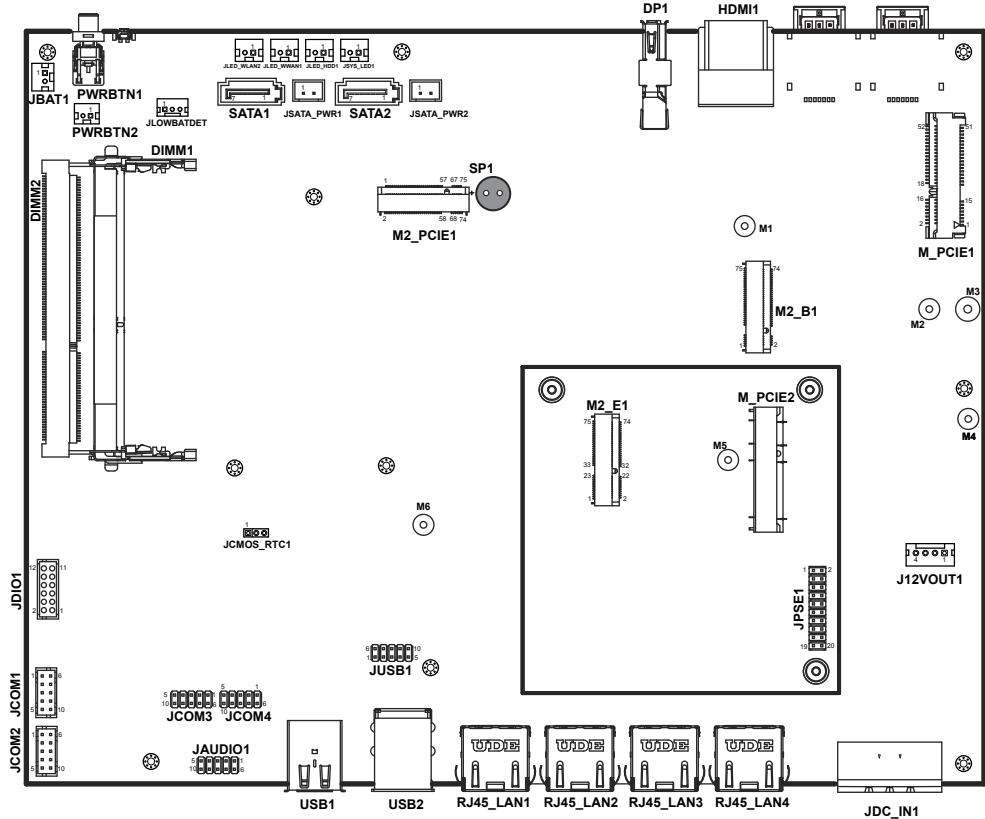

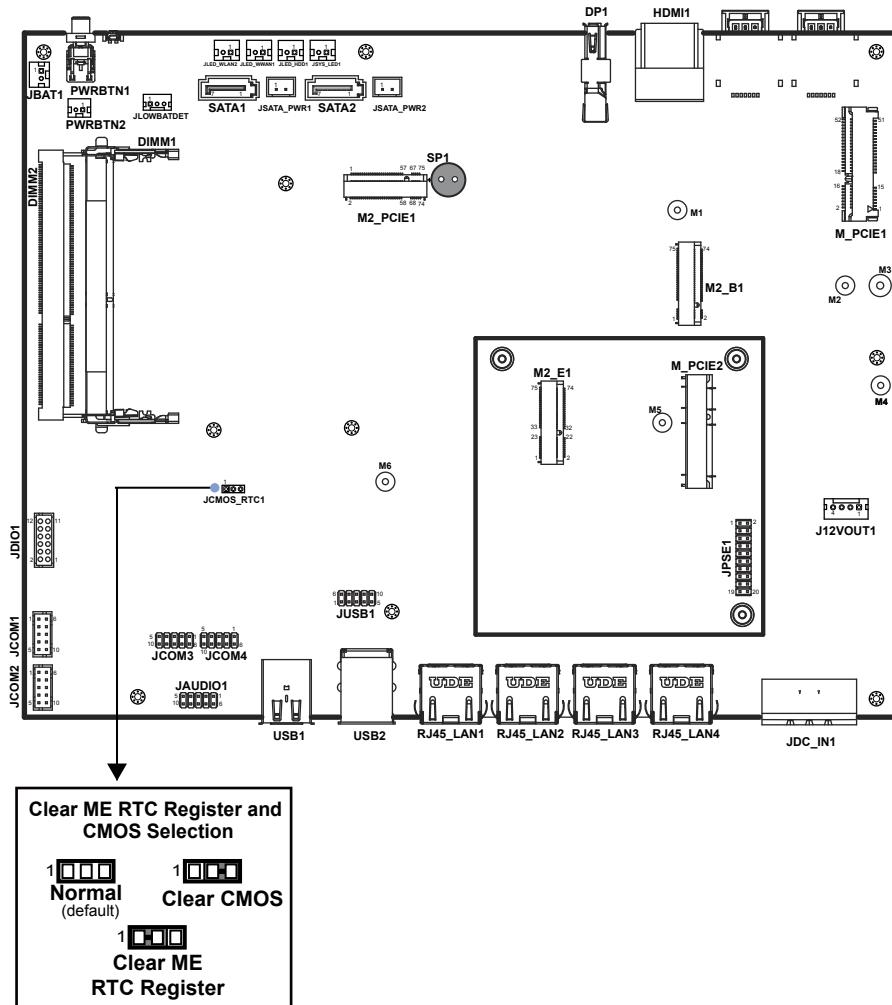

Figure 3-1. Main Board Component Location (Top View)

Notes:

1. In order to have ignition power control for in-vehicle usage, you need to supply IGN signal to the system before enabling “Power On/Off Function” in BIOS.
2. How to set up Power Cable for Ignition Function: The power terminal block connector of IV-Z318 has 3 pins: GND/ VCC/ Ignition. When using power from battery, Ignition has to be in contact with the VCC pin. Or you can simulate vehicle engine start, and then the ignition pin can connect a switch to start the system.

	WARNING: Always disconnect the power cord when you are working with connectors and jumpers on the main board. Make sure both the system and peripheral devices are turned OFF as sudden surge of power could damage sensitive components. Make sure the main board is properly grounded.
	CAUTION: Observe precautions while handling electrostatic sensitive components. Make sure to ground yourself to prevent static charge while you are working on the connectors and jumpers. Use a grounding wrist strap and place all electronic components in any static-shielded devices.
	CAUTION: Always touch the main board components by the edges. Never touch components such as a processor by its pins. Take special care while you are holding electronic circuit boards by the edges only. Do not touch the main board components.

Note: The SIM card sockets do not support hot-plug. Please make sure to power off the system before inserting the SIM card(s).

3.4 How To Set Jumpers

You can configure your board by setting the jumpers. A jumper consists of two or three metal pins with a plastic base mounted on the card. By using a small plastic "cap", also known as the jumper cap (with a metal contact inside), you are able to connect the pins. So you can configure your hardware settings by "opening" or "closing" jumpers.

Jumpers can be combined into sets that are called jumper blocks. When jumpers are all in the block, you have to put them together to set up the hardware configuration. The figure below shows what this looks like.

Jumpers & Caps

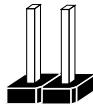

If a jumper has three pins, for example, labeled 1, 2 and 3. You can connect pins 1 and 2 to create one setting and shorting. You can also select to connect pins 2 and 3 to create another setting. The format of the jumper picture will be illustrated throughout this manual. The figure below shows different types of jumpers and jumper settings.

BIOS SETUP

This chapter guides users how to configure the basic system configurations via the BIOS Setup Utilities. The information of the system configuration is saved in BIOS NVRAM so that the Setup information is retained when the system is powered off. The BIOS Setup Utilities consist of the following menu items:

- Main Menu
- Advanced Menu
- Chipset Menu
- Security Menu
- Boot Menu
- Save & Exit Menu

6.1 Introduction

The **IB-Z318** board uses an AMI (American Megatrends Incorporated) Aptio BIOS that is stored in the Serial Peripheral Interface Flash Memory (SPI Flash) and can be updated. The SPI Flash contains the built-in BIOS setup program, Power-On Self-Test (POST), PCI auto-configuration utility, LAN EEPROM information, and Plug and Play support.

Aptio is AMI's BIOS firmware based on the UEFI (Unified Extensible Firmware Interface) specifications and the Intel Platform Innovation Framework for EFI. The UEFI specification defines an interface between the operating system and platform firmware. The interface consists of data tables that contain platform-related information, boot service calls, and runtime service calls that are available to the operating system and its loader. These elements have combined to provide a standard environment for booting the operating system and running pre-boot applications.

The diagram below shows the Extensible Firmware Interface's location in the software stack.

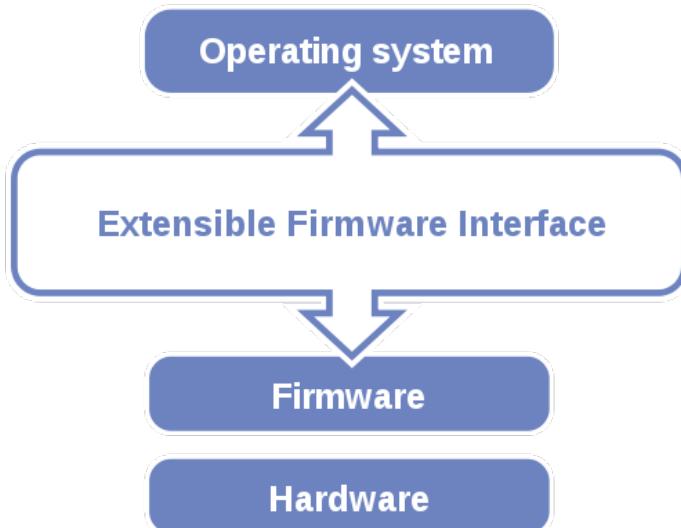

Figure 6-1. Extensible Firmware Interface Diagram

EFI BIOS provides an user interface that allows you to modify hardware configuration, e.g. change the system date and time, enable/disable a system component, determine bootable device priority, set up personal password, etc., which is convenient for engineers to perform modifications and customize the computer system and allows technicians to troubleshoot the occurred errors when the hardware is faulty.

The BIOS setup menu allows users to view and modify the BIOS settings for the computer. After the system is powered on, users can access the BIOS setup menu by pressing or <Esc> immediately while the POST message is running before the operating system is loading.

All the menu settings are described in details in this chapter.

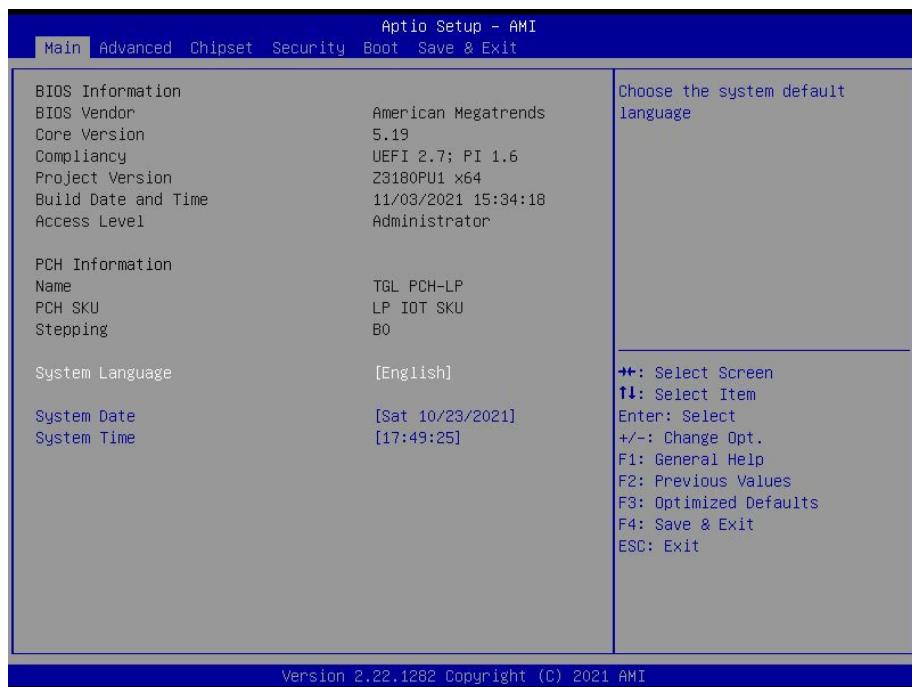

6.2 Accessing Setup Utility

After the system is powered on, BIOS will enter the Power-On Self-Test (POST) routines and the POST message will be displayed:

Figure 6-2. POST Screen with AMI Logo

Press **** or **<Esc>** to access the Setup Utility program and the **Main** menu of the Aptio Setup Utility will appear on the screen as below:

You may move the cursor by $<\uparrow>$ and $<\downarrow>$ keys to highlight the individual menu items. As you highlight each item, a brief description of the highlighted selection will appear on the right side of the screen.

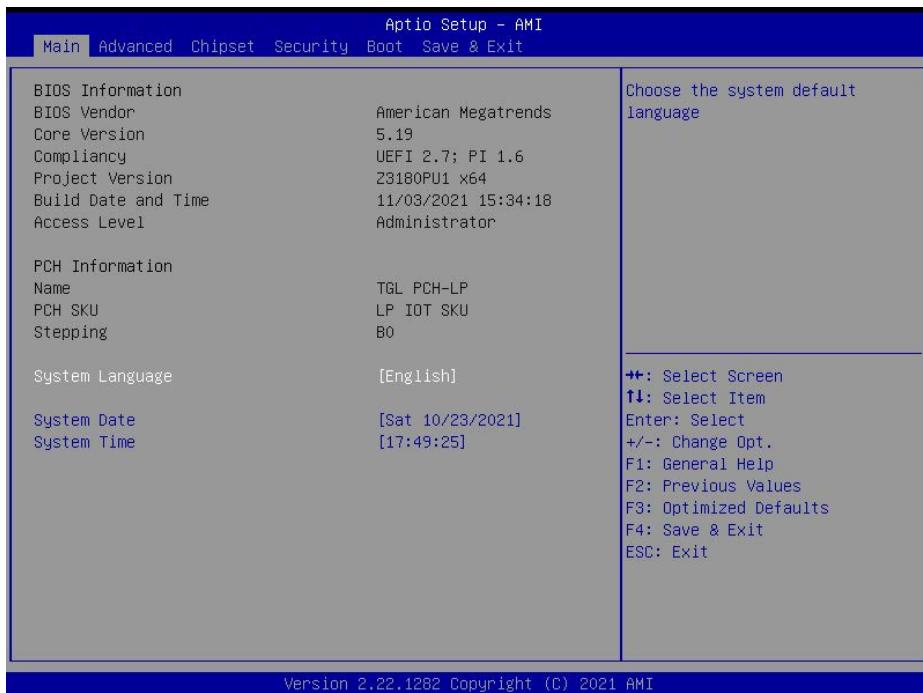

The language of the BIOS setup menu interface and help messages are shown in US English. You may use $<\uparrow>$ or $<\downarrow>$ key to select among the items and press $<\text{Enter}>$ to confirm and enter the sub-menu. The following table provides the list of the navigation keys that you can use while operating the BIOS setup menu.

Ignition Power Management

This chapter explains the principle of ignition power ON/OFF control, force reset delay support, wiring ignition signal and the related setting of Windows.

The following topics are included:

- Ignition Power ON Control Flow
- Ignition Power OFF Control Flow
- Force Reset Delay Support
- Wiring Ignition Signal
- Configure Your Windows System

7.1 Ignition Power ON Control Flow

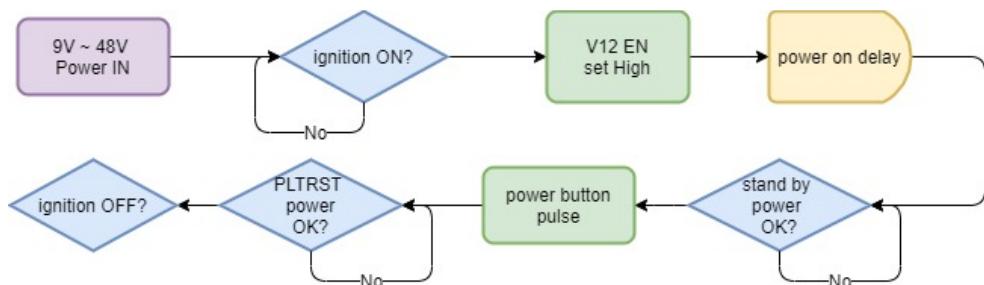

The ignition power control for in-vehicle application is implemented by MCU. MCU monitors the ignition signal and some related signals to turn on/off the system based on predefined power on/off delay setting in BIOS.

In this section, we will explain the principle of ignition power control, wiring and the related setting of Windows.

The Ignition ON control flow is as follows:

1. 9V ~ 48V Power IN.
2. Check ignition signal.
3. Enable 12V power.
4. Run power on delay time.
5. Check standby power OK signal.
6. Send power button signal.
7. Check PLTRST power OK signal.
8. Waiting for Ignition OFF.

- The minimum Power on delay time is 3 seconds, and the maximum Power on delay time is 255 seconds. (Note. **Please refer to BIOS Setting for Power ON delay time setting.**)
- There are 3 ways to shut down the system:
 - Ignition off
 - Use OS shut down
 - Press Power button to shut down

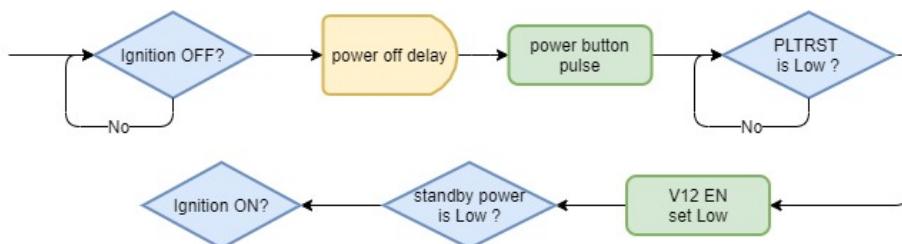

System Ignition Power ON Flow Chart

7.2 Ignition Power OFF Control Flow

The Ignition OFF Control Flow is as follows:

1. Check ignition signal.
 2. Run power off delay time.
 3. Send power button signal.
 4. Check PLTRST power OK signal.
 5. Disable 12V power.
 6. Check standby power OK signal.
 7. Waiting for Ignition ON.
- The minimum Power off delay time is 3 seconds, the maximum Power off delay time is 255 seconds. (Note. **Please refer to BIOS Setting for Power Off delay time setting.**)

System Ignition Power OFF Flow Chart

7.3 Force Reset Delay Support

- If users want to avoid abnormal power on process, they can set the force Reset delay support to enable. When time is up and the system is not powered on yet, the Force Reset function will restart the system in force.
- The setup range of force reset delay is 1 ~10 minutes.
(Note. Please refer to BIOS Setting for Force Reset delay time setting.)

7.4 Wiring Ignition Signal

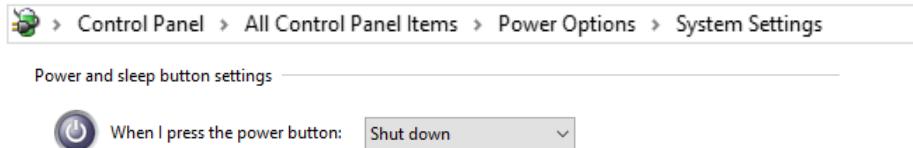

In order to enable ignition power control for in-vehicle usage, you have to supply the IGN signal to the system. The IGN input signal is located on the 3-pin pluggable terminal block which is marked with DC IN 9-48V.

Below is the typical wiring configuration for in-vehicle applications. Please make sure your DC power source and IGN signal share the same ground.

1. Connect power V+ line to “V+” of DC IN terminal block.
2. Connect V-/ GND line to “GND” of DC IN terminal block.
3. Connect ACC line to IGN.

7.5 Configuring Your Windows System

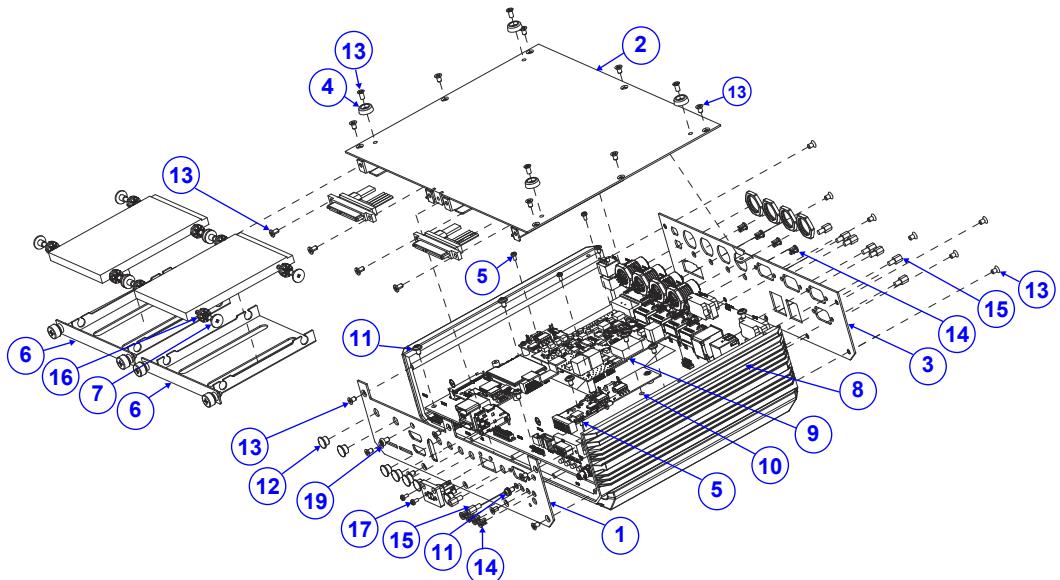

When the ignition control is in used, please check the Power and sleep button settings. The default Item of the power button is “**Sleep**”. In this setting, pressing the power button cannot shut down the system. And the power off control will not perform correctly. Please set the power button setting to “**Shut down**”.

Configuring WatchDog Timer

The I/O port address of the watchdog timer is 2E (hex) and 2F (hex). 2E (hex) is the address port. 2F (hex) is the data port. User must first assign the address of register by writing address value into address port 2E (hex), then write/read data to/from the assigned register through data port 2F (hex).

Configuration Sequence

To program F81967 configuration registers, the following configuration sequence must be followed:

(1) Enter the extended function mode

To place the chip into the Extended Function Mode, two successive writes of 0x87 must be applied to Extended Function Enable Registers (EFERs, i.e. 2Eh or 4Eh).

(2) Configure the configuration registers

The chip selects the Logical Device and activates the desired Logical Devices through Extended Function Index Register (EFIR) and Extended Function Data Register (EFDR). The EFIR is located at the same address as the EFER, and the EFDR is located at address (EFIR+1). First, write the Logical Device Number (i.e. 0x07) to the EFIR and then write the number of the desired Logical Device to the EFDR. If accessing the Chip (Global) Control Registers, this step is not required. Secondly, write the address of the desired configuration register within the Logical Device to the EFIR and then write (or read) the desired configuration register through the EFDR.

(3) Exit the extended function mode

To exit the Extended Function Mode, writing 0xAA to the EFER is required. Once the chip exits the Extended Function Mode, it is in the normal running mode and is ready to enter the configuration mode.

Code example for watch dog timer

Enable the watchdog timer and set the timeout interval to **30** seconds.

```
; ----- Enter to extended function mode -----
mov dx, 2Eh
mov al, 87h

Flash BIOS Update

I. Prerequisites

Prepare a bootable media (e.g. USB storage device) which can boot the system to EFI Shell.

Note: Copy UEFI Shell into the storage device under specific directory path. (/efi/boot/bootx64.efi)

- 1** Download and save the BIOS file (Z3180PU1.bin) to the bootable device.
- 2** Copy AMI flash utility – AfuEfix64.efi (v5.14.01.0015) into a bootable device.
- 3** Make sure the target system can first boot to the bootable device.
 - (1) Connect the bootable USB device.
 - (2) Turn on the computer and press <ESC> or during boot to enter BIOS Setup.
 - (3) Select [**Boot**] menu and set the USB bootable device to be the 1st boot device.
 - (4) Press **F4** to save the configuration and exit the BIOS setup menu.

II. AFUEFI Command for System BIOS Update

AFUEFI command for system BIOS update

AfuEfix64.efi is the AMI firmware update utility; the command line is shown as below:

AfuEfix64 <ROM File Name> [option1] [option2]....

Users can type “**AfuEfix64/ ?**” to see all the definition of each control options. The recommended options for BIOS ROM update include following parameters:

/P: Program main BIOS image.

/B: Program Boot Block.

/N: Program NVRAM.

/X: Don’t check ROM ID.

III. BIOS Update Procedure

- 1 Use the bootable USB storage to boot up the system into the EFI Shell.
- 2 Type "**AfuEfix64 Z318xxxx.bin /p /b /n /x**" and press **Enter** to start the flash procedure.
(Note that xxxx means the BIOS revision part, e.g. 0PM1...)
- 3 During the update procedure, you will see the BIOS update process status and its percentage. Beware! Do not turn off system power or reset your computer if the whole procedure are not complete yet, or it may crash the BIOS ROM and make system unable to boot up next time.
- 4 After the BIOS update procedure is completed, the following messages will be shown:

```

- 5 Restart the system and boot up with the new BIOS configurations.
- 6 The BIOS Update is completed after the system is restarted.

- 7 Reboot the system and verify if the BIOS version shown on the initialization screen has been updated.
